Abstract

Two new species of predaceous midges of the subgenus Eukraiohelea Ingram & Macfie of Stilobezzia Kieffer are described and illustrated: Stilobezzia (Eukraiohelea) proxima n. sp. and S. (E.) quasielegantula n. sp. The previously known New World species, Stilobezzia (E.) elegantula (Johannsen) is redescribed and illustrated. The species are illustrated through photomicrographs from adult males and females collected in the Brazilian state of Rio de Janeiro. A key to adults of the five American species of Stilobezzia (Eukraiohelea) is also provided.

Key words: Ceratopogoninae, Ceratopogonini, taxonomy, new species, Río de Janeiro

Resumo

Duas novas espécies de ceratopogonídeos predadores do subgênero Eukraiohelea Ingram & Macfie de Stilobezzia Kieffer são descritas e ilustradas: Stilobezzia (Eukraiohelea) proxima n. sp. e S. (E.) quasielegantula n. sp. A espécie do Novo Mundo previamente conhecidas, Stilobezzia (E.) elegantula (Johannsen), é redescrita e ilustrada. As espécies são ilustradas por microfotografias de machos e fêmeas coletados no estado do Rio de Janeiro, Brazil. É fornecida uma chave dos adultos de Stilobezzia (Eukraiohelea) para as cinco espécies do continente americano.

Palavras-chave: Ceratopogoninae, Ceratopogonini, taxonomia, espécies novas, Río de Janeiro

Introduction

Stilobezzia Kieffer is a large, diverse genus of predaceous Ceratopogonidae, in the tribe Ceratopogonini of the subfamily Ceratopogoninae. Four subgenera are currently recognized: the cosmopolitan Acanthohelea Kieffer and Stilobezzia Kieffer, Debenhamia Wirth & Grogan, in Australia, and Eukraiohelea Ingram & Macfie from Africa, America and southeastern Asia.

Species in the subgenus Eukraiohelea are distinguished by their wing with a single, elongate radial cell, short, stout spines on their fore femur and tarsomeres 5 of both sexes with enlarged, stout, setae called "batonnets". Presently, there are 344 species of Stilobezzia, however, only 12 species in the subgenus Eukraiohelea are recognized (Borkent, 2016) of which only three are known from the Neotropical region: S. (E.) amnigena (Macfie) and S. (E.) elegantula (Johannsen), known from both sexes, and S. (E.) dorsofasciata (Lutz), known from a single female. All three of these species are reported in the Brazilian States of Maranhão, Amazonas and Rio de Janeiro, respectively (Santarém & Felippe-Bauer, 2017). Stilobezzia elegantula was recorded in the Nearctic region by Wirth (1953) and Wirth & Grogan (1981), and it is presently known in the USA from Kansas and Maryland, south to Louisiana and Florida (Borkent & Grogan 2009). Subsequently, Wirth & Spinelli (1992) noted that S. amnigena...
was misidentified as *S. elegantula* by Wirth (1953) and Wirth & Grogan (1981) from Florida and Maryland specimens, and they redescribed and partially illustrated both species, and provided a key to the American species of *Eukraiohelea*, including *S. (E.) subsessilis* Kieffer, which is now considered a synonym of *S. (E.) elegantula* (Spinelli & Cazorla, 2005; Borkent 2016).

During field samplings carried out in the Atlantic forest of southeastern Brazil, several species of *Stilobezzia* were collected, including three in the subgenus *Eukraiohelea: Stilobezzia elegantula* and two undescribed species. Herein, we describe and provide photomicrographs of the most important diagnostic characters of the two new species and *S. (E.) elegantula*, as well as a key to adults of the American species of the subgenus *Eukraiohelea*. Including the two new species described herein, there are now five species of *Stilobezzia (Eukraiohelea)* in the Neotropics, all of which inhabit Brazil.

**Materials and methods**

Specimens were collected with Malaise trap in Union Biological Reserve (22°25′35″ S, 42°2′4″ W), Casimiro de Abreu, Rio de Janeiro State, Brazil (Fig. 43). Specimens were preserved in glycerin and subsequently cleared, dissected and mounted onto microscope slides in phenol-balsam in the manner described by Wirth & Marston (1968). They were examined, measured and photographed with a Nikon Eclipse E 200 microscope with a Motican 2300 digital camera and the plates were prepared using GIMP Portable 2.6.

Terms of structures follows those in the Manual of Central America Diptera (Borkent et al. 2009). In males of *Stilobezzia* the distal three flagellomeres usually differ in length and shape from the proximal 10, so their antennal ratios were obtained by dividing the combined lengths of the distal three flagellomeres by the combined lengths of the preceding 10 flagellomeres.

The holotypes, allotypes and paratypes of the two new species and other specimens studied of *S. (E.) elegantula* are deposited in the Coleção de Ceratopogonidae (FIORCUZ/CCER), Instituto Oswaldo Cruz, Fundação Oswaldo Cruz, and paratypes of *S. (E.) quasielegantula* are also deposited in the Entomological Collection of the División Entomología del Museo de La Plata, La Plata, Argentina (MLPA).

**Results**

**Key to the American species of Stilobezzia (Eukraiohelea)**

**Stilobezzia** *subsessilis* Kieffer, 1917: 311 (female; Paraguay); Lane & Forattini 1961: 88 (subgeneric position; Wirth & Spinelli 1992: 348 (as *species inquereda*); Spinelli & Cazorla 2005: 73 (as synonym of *S. elegantula*).

**Diagnosis.** The only American species of *Stilobezzia* (Eukraiohelea) of medium to large size (wing length 1.27–1.48 mm) with pale yellowish coloration and distinctive L-shaped dark brown spots on abdominal tergites and basal 1/3 of hind femur brown. Male with proximal 1/3 of gonocoxite pale yellowish and the distal 2/3 contrasting dark brown, and a rectangular sclerite located ventrally at midlength of stem of parameres. Female with two pairs of batonnets on tarsomere 5 of all legs.

**Redescription of male.** Head (Fig. 1) dark brown. Antenna with flagellomeres 1–10 pale yellowish basally, brown distally, flagellomeres 11–13 dark brown with pale yellowish basal ring; flagellomere 13 nearly twice as long as 12; plume dark brown, dense; antennal ratio 1.09–1.23 (1.17, n = 7). Palpus (Fig. 2) dark brown; third segment moderately stout with subapical, round shallow sensory pit; palpal ratio 2.37–3.14 (2.87, n = 7).

Thorax. Scutum brown (as Fig. 8, female), anterolateral margins darker, prescutellar depression pale yellowish; scutellum pale yellowish except narrow lateral margins brown, with 4 stout setae, 0–2 thinner setae; postscutellum dark brown. Legs pale yellowish; trochanters dark brown; apex of fore tibia dark brown; basal 1/3, narrow apex of hind femur brown; basal 1/3, narrow apex of hind tibia dark brown; fore femur with 2–3 short, stout ventral spines; tarsomere 1 of mid leg with basal, slender, straight spine; tarsomere 1 of hind leg with basal, stout, curved spine; hind tibial comb with 5 spines; fore leg tarsal ratio 2.21–2.63 (2.34, n = 8); mid leg tarsal ratio 2.78–3.03 (2.87, n=8); hind leg tarsal ratio 2.40–2.62 (2.49, n = 8); tarsomere 5 of all legs (Fig. 3) with 1 pair of batonnets, claws large, shorter than their respective tarsomere 5 with long basal tooth, hind claws longest. Wing (Fig. 4) membrane hyaline; r-m crossvein oblique; cubital fork distal to level of base of r-m crossvein; wing length 1.27–1.45 (1.35, n = 8) mm, width 0.44–0.48 (0.45, n = 8) mm; costal ratio 0.72–0.75 (0.74, n = 8). Halter stem pale; basal half of knob brown, distal half pale.

Abdomen. Pale yellowish, with distinctive dark marks on the lateral margins of the tergites. Genitalia (Figs. 5–7): tergite 9 extending to apex of gonocoxites, distal margin rounded with small mesal notch; cerci slender, rectangular; sternite 9 2.80 X broader than long with convex posteromedian projection. Gonocoxite nearly triangular, stout, 1.7 X longer than greatest breadth, proximal 1/3 pale yellowish, distal 2/3 dark brown with a hyaline membrane extending from dorsal inner margin to near apex of parameres, the basolateral margins slightly sclerotized, lobe-shaped, distal margin rounded; gonostylus pale yellowish, slender, 0.75 X the length of gonocoxite, tip curved. Parameres separate, subparallel, heavily sclerotized; basal apodemes stout with stem not reaching margin of tergite 9; proximal 1/2 of parameres slender basally, distal 1/2 gradually broadening, apices recurved ventrally, tips pointed (Fig. 7); a rectangular sclerite located ventrally at midlength of stem of parameres. Aedeagus represented by 2 slender, arched sclerites; basal portion heavily sclerotized, curved, basal arms recurved; distal portion sclerotized, apices pointed, overlapping.

**Redescription of female** (Fig. 8). Similar to male, with the following notable sexual differences. Head (Fig. 9). Antenna with flagellomeres 1–8 pale yellowish basally, brown distally, flagellomeres 9–13 brown with pale basal ring; antennal ratio 1.35–1.53 (144, n = 7). Palpal ratio 2.75–3.00 (2.90, n = 8). Mandible with 6–8 teeth.
FIGURES 1–7. Stilobezzia (Eukraiohelea) elegantula (Johannsen). Male. 1. head, dorso-frontal view. 2. apex of proboscis and palpi. 3. tarsomeres 5 and claws. 4. wing. 5. genitalia, dorsal view. 6. genitalia, ventral view. 7. apices of parameres. Scale bars 0.05 mm.
FIGURES 8–14. Stilobezzia (Eukraiohelea) elegantula (Johannsen). Female. 8. thorax and abdomen, dorsal view. 9. head, frontal view. 10. legs. 11. tarsomeres 5 and claws. 12. wing. 13. abdomen, ventral view. 14. sternites 7–10 of abdomen and spermathecae, ventral view. Scale bars: 0.05 mm.
Thorax. (Fig. 8). Legs (Fig. 10): fore femur with 2 ventral spines; tarsomere 5 of all legs with 2 pairs of batonnet (Fig. 11); fore tarsal ratio 2.21–2.36 (2.30, n = 8), mid tarsal ratio 2.64–2.83 (2.73, n = 8), hind leg tarsal ratio 2.30–2.70 (2.53, n = 8); tarsomere 5 of all legs with claws almost as long as tarsomere with long basal tooth. Wing (Fig. 12) length 1.33–1.48 (1.40, n = 8) mm, width 0.55–0.60 (0.58, n = 8) mm; costal ratio 0.75–0.80 (0.79, n = 8).

Abdomen (Figs. 8, 13). Lateral broad margins of segment 8 dark brown. Genitalia (Fig. 14): sternite 8 pale, with U-shaped posteromedian excavation; sternite 9 divided, each half slender with inner 1/3 straight, sclerotized, margin recurved; sternite 10 pale with 3–4 pairs of setae; cercus rounded, short; two large, subequal, ovoid spermathecae with moderately wide, short necks, measuring 53–58 (55, n = 5) µ by 40–48 (43, n = 5) µ and 50–55 (50, n = 5) by 38–45 (40, n = 5) µ; a small, round, rudimentary third spermatheca measuring 10 (n = 7) µ.

Distribution. Argentina (Chaco, Misiones), Brazil (Amazonas, Rio de Janeiro), Mexico, Panama, Paraguay, (? Puerto Rico, USA (Kansas to Maryland, south to Louisiana and Florida).

Types. Types of Bezzia eleginula not designated by Johannsen (1907). Wirth & Spinelli (1992) noted that females were labeled "Collected in July at electric light on bridge across Kansas river at Lawrence, Douglas County, Kansas, by E. S. Tucker.", in the Snow Entomological Collection, University of Kansas, Lawrence.

Material examined. 9 males, 10 females, as follows: 8 males, 9 females, BRAZIL, Rio de Janeiro, Casimiro de Abreu, Union Biological Reserve (22°25′35" S 42°2′4"W), 07.XI–26.XI.2013, "Biota Diptera Fluminense" team col., Malaise trap (CCER); 1 male, 1 female, same data except 13.XII.2013 (CCER).

Discussion. The American species Stilobezzia (E.) elegantula is similar to S. (E.) punctifemorata Das Gupta & Wirth, from Southeast Asia. The latter species can be clearly distinguished by the yellowish thorax with a peculiar dark brown pattern of coloration on the scutum, the presence of only one pair of batonnet on the female hind tarsomeres 5 and the aedeagal sclerites have a large expansion at their distomesal end. Furthermore, the presence of a rectangular sclerite located anterior to the parameres of S. elegantula resembles the male genitalia of S. (E.) brevicostalis Das Gupta & Wirth, another species from Southeast Asia in which the parameres are enclosed within a dark band-like sclerotized bridge. This Asian species differs from S. elegantula by the stout black spine near the base of the male hind femur and the parameres have a large lateral lobe and a slender anterior arm.

Wirth (1953) noted that males of the subgenus Eukraiohelea have an aedeagus with a hyaline posterior membrane. We confirm that males of S. elegantula have such a hyaline membrane, but it extends from the dorsal inner margin of the gonocoxites to near the apices of the parameres and that the lateral margins are lightly sclerotized. Finally, in males of S. (E.) elegantula, the apices of the parameres are usually pointed, however in some specimens the apices are difficult to see and they are apparently blunt (Fig. 6).

Stilobezzia (Eukraiohelea) proxima Cazorla & Felippe-Bauer n. sp.

(Figs. 15–28)

Diagnosis. The only Neotropical species of Stilobezzia (Eukraiohelea) of large size (wing length 1.50–1.82 mm) with pale yellowish coloration and the lateral margins of abdominal tergites with dark brown stripes. Male with stout gonocoxites; gonostyli short, swollen at mid portion with curved apex and pointed tip; apicolateral processes short, rounded and parameres with short, ventrally directed tip. Female with tarsomere 5 of fore and mid legs with 2 pairs of batonets, tarsomere 5 of hind leg with 1 pair of batonets and two ovoid spermatheca measuring 87–90 µ.

Male (Fig. 15). Head (Fig. 16) dark brown. Antenna with flagellomeres 1–10 pale yellowish basally, light brown distally, flagellomeres 11–13 dark brown with light brown basal ring; flagellomere 13 2.5X longer than flagellomere 12; plume brown, poorly developed; antennal ratio 1.30. Palpus (Fig. 17) with segments 3–5 dark brown, 1–2 light brown; third segment elongate with subapical sensory pit; palpal ratio 3.50 (n = 2).

Thorax. Scutum brown (as Fig. 15, female), two faint yellowish lateral vittae extending posteriorly from paler humeral pits; scutellum pale yellowish except narrow lateral margins brown with 4 stout setae, 2–3 thinner setae; postscutellum brown. Legs pale yellowish; basal 1/3 of mid tibia slightly darker; narrow apex of hind femur dark brown; basal 1/3, narrow apex of hind tibia dark brown; fore femur with 2–3 short stout ventral spines; tarsomere 1 of mid leg with slender, straight basal spine; tarsomere 1 of hind leg with stout, curved basal spine; hind tibial comb with 6 spines; fore leg tarsal ratio 2.41–2.45 (2.43, n = 2); mid leg tarsal ratio 2.78–2.90 (2.79, n = 2); hind leg
tarsal ratio 2.69–2.88 (2.79, n = 2); tarsomere 5 of all legs with 1 pair of batonnets (Fig. 18) and large claws with long basal tooth. Wing (Fig. 19) membrane hyaline; r-m crossvein oblique; cubital fork distal to level of base of r-m crossvein; wing length 1.50–1.63 (1.57, n = 2) mm, width 0.50 (n = 2) mm; costal ratio 0.72–0.75 (0.73, n = 2). Halter stem dark brown; basal half of knob dark brown, distal half pale.

Abdomen. Pale yellowish, lateral margins of tergites brown. Genitalia (Figs. 20–22): tergite 9 extending slightly beyond apex of gonocoxites, distal margin rounded with small mesal notch, apicomedial processes short with rounded apices, located laterad to the slender cerci (Fig. 22); sternite 9 2.50 X broader than long, posterior margin not clearly distinguishable, apparently straight. Gonocoxite stout, 2.0 X longer than greatest breadth, each with a hyaline membrane extending from the dorsal inner margin to nearly 2/3 of the length of parameres, lateral broad margins of the membrane sclerotized, folded, connected dorsally by a broad, sclerotized transversal bridge; gonostylius pale yellowish, 0.60 X the length of gonocoxite, swollen at mid portion, tip curved, pointed. Parameres separate, parallel; gonocoxal apodemes moderately sclerotized, broad, fused to dorsum of basal arms of parameres; basal arms stout, blade-like, apices rounded, divergent; distal portions slender, rod-like, closely approximated except on apices, which gradually taper to slightly broader ventrally curved, pointed tips. Aedeagus represented by 2 arched sclerites; basal portion heavily sclerotized, recurved; subapical portion slightly swollen, more lightly sclerotized; distal portion pointed, tips overlapping.

**Female.** Similar to male, with the following notable sexual differences: Head (Fig. 23). Antenna to flagellomeres 1–8 pale yellowish basally, pale brown distally, flagellomeres 9–13 dark brown with pale basal ring; antennal ratio 1.73–1.92 (1.82, n = 2). Palpal ratio 3.50–3.75 (3.60, n = 2). Mandible with 7–8 teeth.

Thorax. Legs (Fig. 24): fore femur with 2–4 short, stout ventral spines; tarsomere 5 of fore and mid legs with 2 pairs of batonnets, tarsomere 5 of hind leg with 1 pair of batonnets (Fig. 25); fore leg tarsal ratio 2.33–2.44 (2.38, n = 2); mid leg tarsal ratio 2.65–2.72 (2.68, n = 2); hind leg tarsal ratio 2.75–2.86 (2.80, n = 2); claws slightly shorter than their respective tarsomeres 5, with moderately long basal tooth. Wing (Fig. 26) length 1.75–1.82 (1.78, n = 2) mm, width 0.65–0.68 (0.66, n = 2) mm; costal ratio 0.76–0.77 (0.76, n = 2).

Abdomen. (Fig. 27). Broad lateral margins of segment 8 dark brown. Genitalia (Fig. 28): sternite 8 pale, narrow, with U-shaped posteromedian excavation; sternite 9 halves heavily sclerotized, anterior margins straight, posterior margins curved, apices broader, decumbent; sternite 10 pale with 3–4 pairs of setae; cercus rounded, short. Two subequal, ovoid spermathecae with short, moderately wide necks, measuring 90 by 57 (n=2) µm and 87 by 57 (n = 2) µm; a small, spheroid rudimentary third spermatheca measuring 12–15 (13.5, n = 2) µm.

**Etymology.** The species name proxima (from Latin = near), refers to the resemblance of this new species with Stilobezzia (E.) elegans and S. (E.) quasielegans n. sp. described below.

**Types.** Holotype male, labeled “Holotype Stilobezzia (Eukraiohelea) proxima Cazorla and Felippe-Bauer, BRAZIL, Rio de Janeiro, Casimiro de Abreu, Union Biological Reserve (22°25’35” S 42°2’4” W), 07.XI–13.XII.2013, "Biota Diptera Fluminense" team col, Malaise trap, (CCER). Allotype female, 1 male paratype with same data as holotype (CCER); other paratypes, 1 male, 1 female with same data except 25.VIII–26.XI.2013", (CCER).

**Distribution.** Brazil (Rio de Janeiro).

**Species of Stilobezzia (Eukraiohelea), Brazil.**

**Stilobezzia (Eukraiohelea) quasielegantula** Cazorla & Felippe-Bauer n. sp.  
(Figs. 29–42)

**Diagnosis.** The only Neotropical species of *Stilobezzia (Eukraiohelea)* of medium size (wing length 1.17–1.37 mm) with general coloration pale yellowish and brown transverse bands on abdominal tergites with two small, round clear spots on their mid portions. Male gonocoxite with a conspicuous sclerotized membrane arising from dorsal inner margin; gonostylus swollen subapically with curved, sclerotized pointed apical projection; and apices of parameres greatly elongate and recurved 100°. Female with tarsomere 5 of fore and mid legs with 2 pairs of batonnets and tarsomere 5 of hind leg with only 1 pair.

**Male.** Head. (Fig. 29) dark brown. Antenna with flagellomeres 1–10 pale brown basally, brown distally, flagellomeres 11–13 dark brown with pale brown basal ring; flagellomere 13 more than twice as long as 12; plume brown, well developed; antennal ratio 1.07–1.23 (1.15, n = 7). Palpus (Fig. 30) dark brown; third segment elongate with small, shallow subapical sensory pit; palpal ratio 3.00–3.70 (3.47, n = 10).

Thorax. Scutum pale brown (as Fig. 42, female), prescutellar depression light yellowish; scutellum light yellowish with 4 stout, 1–2 thinner setae; postscutellum brown. Legs yellowish; narrow apex of hind femur, basal 1/3, narrow apex of hind tibia dark brown; fore femur with 2–3 short, stout ventral spines; tarsomere 1 of mid leg with long, slender, straight basal spine; tarsomere 1 of hind leg with stout, slightly curved basal spine; hind tibial comb with 5–6 spines; fore leg tarsal ratio 2.50–2.67 (2.60, n = 9); mid leg tarsal ratio 2.75–3.04 (2.92, n = 7); hind leg tarsal ratio 2.62–2.85 (2.72, n = 10); tarsomere 5 of all legs with 1 pair of batonnets (Fig. 31), claws large, with long basal tooth, claws of hind leg longest. Wing (Fig. 32) membrane hyaline; r-m crossvein oblique; cubital fork distal to level of base of r-m crossvein; wing length 1.17–1.25 (1.20, n = 10) mm, width 0.40–0.45 (0.40, n = 10) mm; costal ratio 0.70–0.75 (0.72, n = 10). Halter dark brown.

Abdomen. Tergites with broad transverse dark brown bands with two small, round pale spots on their midlines; sternites dark yellowish. Genitalia (Figs. 33–35): tergite 9 extending slightly beyond apices of gonocoxites, distal margin rounded with very shallow mesal notch; apicolateral processes lobate, moderately elongate, slender, overlapping along their inner margins with the broad, rectangular cerci (Fig. 35); sternite 9 2.80 X broader than long, posteromedian portion not clearly distinguishable. Gonocoxite 1.8 X longer than greatest breadth, stout proximally, nearly triangular, tapering distally with a sclerotized membrane extending from dorsal inner margin to apices of parameres, lateral margins straight, outer margins are slightly curved distally they don’t converge; gonostylus light brown, stout, 0.70 X the length of gonocoxite, swollen subapically with a sclerotized, curved, pointed projection. Parameres parallel, gonocoxal apodemus stout, bilobed; proximal ¼ portions slender, sclerotized, distal ¾ portions broader, apices elongate, greatly divergent, recurved 100°, tapering to pointed tips. Aedeagus (Fig. 34) represented by 2 arched, slender sclerites, each with basal portion curved, sclerotized, distal portion rounded, sclerotized.

**Female** (Fig. 42). Similar to male, with the following notable sexual differences: Head (Fig. 36). Antenna with proximal ½ of flagellomeres 1–8 pale brown, distal 1/2 dark brown, flagellomeres 9–13 dark brown with pale basal ring; antennal ratio 1.42–1.62 (1.53, n = 8). Palpal ratio 3.10–4.00 (3.60, n = 8). Mandible with 7–8 teeth.

Thorax. Legs (Fig. 37): tarsomere 5 of fore leg, mid leg with 2 pairs of batonnets, hind leg with 1 pair of batonnets (Fig. 38); fore leg tarsal ratio 2.50–3.08 (2.65, n = 9); mid leg tarsal ratio 2.77–3.04 (2.88, n = 9); hind leg tarsal ratio 2.62–2.85 (2.72, n = 10); tarsomere 5 of all legs with 1 pair of batonnets (Fig. 31), claws large, with long basal tooth, claws of hind leg longest. Wing (Fig. 32) membrane hyaline; r-m crossvein oblique; cubital fork distal to level of base of r-m crossvein; wing length 1.17–1.25 (1.20, n = 10) mm, width 0.40–0.45 (0.40, n = 10) mm; costal ratio 0.70–0.75 (0.72, n = 10). Halter dark brown.

Abdomen. Tergites with broad transverse dark brown bands with two small, round pale spots on their midlines; sternites dark yellowish. Genitalia (Figs. 33–35): tergite 9 extending slightly beyond apices of gonocoxites, distal margin rounded with very shallow mesal notch; apicolateral processes lobate, moderately elongate, slender, overlapping along their inner margins with the broad, rectangular cerci (Fig. 35); sternite 9 2.80 X broader than long, posteromedian portion not clearly distinguishable. Gonocoxite 1.8 X longer than greatest breadth, stout proximally, nearly triangular, tapering distally with a sclerotized membrane extending from dorsal inner margin to apices of parameres, lateral margins straight, outer margins are slightly curved distally they don’t converge; gonostylus light brown, stout, 0.70 X the length of gonocoxite, swollen subapically, apex with a sclerotized, curved, pointed projection. Parameres parallel, gonocoxal apodemus stout, bilobed; proximal ¼ portions slender, sclerotized, distal ¾ portions broader, apices elongate, greatly divergent, recurved 100°, tapering to pointed tips. Aedeagus (Fig. 34) represented by 2 arched, slender sclerites, each with basal portion curved, sclerotized, distal portion rounded, sclerotized.
males, 8 females with same data as holotype (7 males, 6 females, CCER; 2 males, 2 females, MLPA); 1 male, 1 female with same data except 25.VIII–26.XI.2013 (CCER).

FIGURES 29–35. Stilobezzia (Eukraiohelea) quasielegantula Cazorla & Felippe-Bauer n. sp. Male. 29. head, dorso-frontal view. 30. proboscis and palpi. 31. tarsomeres 5 and claws. 32. wing. 33. genitalia, dorsal view. 34. genitalia, ventral view. 35. detail of cerci and apicolateral processes. Scale bars: 0.05 mm.
FIGURES 36–42. Stilobezzia (Eukraiohelea) quasielegantula Cazorla & Felippe-Bauer n. sp. Female. 36. head, frontal view. 37. legs. 38. tarsomeres 5 and claws 39 wing. 40. abdomen, ventral view. 41. sternites 7–10 of abdomen and spermathecae. 42. habitus, dorsolateral view. Scale bars: 0.05 mm.
Etymology. The species name *quasielegantula* refers to the great resemblance of this new species with its congener *S. (E.) elegantula*.

Discussion. *Stilobezzia (E.) quasielegantula* n sp. is very similar to *S. (E.) elegantula* and the new species *S. (E.) proxima*. Characters for distinguishing these two species from this new species are in key and in the discussion section of the latter species.
