

## SCIENTIFIC NOTE

## New combination and new synonymy in the tribes Megalonotini and Lethaeini (Hemiptera: Rhyparochromidae)

■ **ABSTRACT.** The syntypes of *Lamprodema inerme* Berg a Megalonotini, deposited in the collection of Museo de La Plata (Argentina) are examined and transferred to the monotypic genus *Stictolethaeus* O'Donnell in the tribe Lethaeini as *Stictolethaeus inerme* (Berg) (**new combination**) and *Stictolethaeus slateri* O'Donnell is treated as a junior synonym of *Lamprodema inerme* (**new synonymy**). The absence of inner laterotergites in the macropterous syntype reveals that further studies are needed in order to establish the correct position of *Stictolethaeus inerme* within a tribe.

**KEY WORDS.** Rhyparochromidae. Lethaeini. Megalonotini. *Stictolethaeus inerme*. New combination.

■ **RESUMEN. Nueva combinación y sinonimia en las tribus Megalonotini y Lethaeini (Hemiptera: Rhyparochromidae).** El material tipo de *Lamprodema inerme* Berg, un Megalonotini, depositado en la colección del Museo de La Plata (Argentina) es examinado y la especie es transferida al género monotípico *Stictolethaeus* O'Donnell en la tribu Lethaeini como *Stictolethaeus inerme* (Berg) (**nueva combinación**) y *Stictolethaeus slateri* O'Donnell es relegada a sinónimo junior de *Lamprodema inerme* (**nueva sinonimia**). La ausencia de laterotergitos internos en el único ejemplar macróptero conocido revela que son necesarios más estudios para establecer la correcta ubicación de *S. inerme*.

**PALABRAS CLAVE.** Rhyparochromidae. Lethaeini. Megalonotini. *Stictolethaeus inerme*. Nueva combinación.

*Lamprodema inerme* Berg 1883, the unique species of the tribe Megalonotini presently known in the Neotropical region (Lethierry & Se-verin, 1894; Pennington, 1921; Slater, 1964) was originally described based on one macropterous male and one coleopteroid female collected by Félix Lynch Arribálzaga in Chacabuco, Buenos Aires province, Argentina (Berg, 1883).

Subsequent publications, such as "Zoogeography of the Rhyparochrominae" (Slater, 1986) and "True Bugs of the World" (Schuh & Slater, 1995), ignored the presence of this species in the Neotropics. Moreover, Slater considered that the species does not belong to *Lamprodema* Fieber,

and consequently that the tribe is not represented in this region (pers. comm).

In order to clarify the generic position of *L. inerme* we examined its syntypes, as well as an additional male specimen from the Argentina, province of Entre Ríos, also deposited in the collection of Museo de La Plata, Argentina. In the end we determined that the species belongs to the monotypic genus *Stictolethaeus* O'Donnell 1991 in the tribe Lethaeini, *Stictolethaeus inerme* (Berg 1883) (**new combination**), and *Stictolethaeus slateri* O'Donnell 1991 is relegated to a junior subjective synonym of *Lamprodema inerme* (**new synonymy**). For this reason, in accordance with

Slater (1986) and Schuh & Slater (1995), we consider that the tribe Megalonotini has no representatives in the Neotropical region.

*Stictolethaeus* was described by O'Donnell (1991) to include *S. slateri* which exhibits several distinctive morphological characters, including a highly modified, unique genitalia and unusual sexual dimorphism. She studied 236 coleopteroid female and male specimens from several places in Argentina (Buenos Aires, Catamarca, Córdoba, and Santa Fe provinces) and Uruguay (Maldonado, Montevideo, Paysandú, and Rocha departments), pointing out that "features associated with coleoptery include loss of the hind wing, desclerotization of the anterior tergites in the female and perhaps the loss of inner laterotergites".

The macropterous syntype of *L. inerme* examined during the present study lacks inner laterotergites, as it is usual in coleopteroid forms. Because the presence of inner laterotergites is characteristic of the tribe Lethaeini, this finding reveals that further studies are needed in order to establish the correct position of *Stictolethaeus inerme* within a tribe. Finally, the macropterous male is herein designated as lectotype and the female specimen as paralectotype.

Our gratitude to G. Spinelli (División Entomología, Facultad de Ciencias Naturales y Museo, UNLP) for his critical reading of the manuscript.
