

PECULIAR STARS IN THE SOUTHERN HEMISPHERE

by

Mercedes Jaschek and Carlos Jaschek

(La Plata Observatory)

Results from a program of spectral classification of the A-type stars south of -30° , and with magnitudes between 5^m0 and 7^m0 , which according to the Henry Draper Catalogue show some spectral peculiarity, are presented. Twenty-six new peculiar A type stars are listed and classified. The paper will be published in full elsewhere.
